Attempt History

Attempt #1
Aug 06, 5:20 PM

Marks: 4

Q No: 1 Correct Answer

Marks: 1/1

Which of the given options is not a type of data structure in Python?

- ○ Tuple
- ◉ Boolean — You Selected
- ○ Dictionary
- ○ List

Boolean is a type of variable in Python and not a data structure (collection of variables). Tuple, Dictionary, and List are data structures in Python.

Q No: 2 Correct Answer

Marks: 1/1

Identify the correct statement for the following dictionary

```
X={1:"USA", 2:"India", 3:"China"}
```

- ○ 1, 2 and 3 are keys of dictionary
- ○ USA, India and China are the values of dictionary
- ○ There are total three items in the dictionary
- ◉ All of the above You Selected

Here, the dictionary name is X and the values stored in it is:

```
X={1:"USA", 2:"India", 3:"China"}
```

Here, 1, 2, and 3 are keys and USA, India and China are values for the respective keys. So there are 3 values that are stored in the X dictionary. Hence, all the statements mentioned are True.

Q No: 3 Correct Answer

Marks: 1/1

What will be the output of the following code?

```
dictionary={1:"USA", 2:"India", 3:"China"}
dictionary.update({3:"Japan"})
print(dictionary)
```

- {3:"Japan"}
- {1:"USA", 2:"India", 3:"China"}
- {1: 'USA', 2: 'India', 3: 'Japan'} — You Selected
- Error

The original dictionary is {1:"USA", 2:"India", 3:"China"}. The update() method updates the dictionary item having specific key. Therefore dictionary.update({3:"Japan"}) will update the third item of the dictionary i.e. "China" will be replaced by "Japan". So the updated dictionary will be {1: 'USA', 2: 'India', 3: 'Japan'}.

Q No: 4 Correct Answer

Marks: 1/1

What will be the output of the following code?

```
dictionary={1:"USA", 2:"India", 3:"China"}
dictionary.pop(2)
print(dictionary)
```

- {3:"China"}
- {1: 'USA', 2: 'India'}
- {1: 'USA', 3: 'China'} — You Selected
- Error

The pop() method in the dictionary is used to pop an item having a specified key. So here dictionary.pop(2) will pop out the item having key 2 from the dictionary.
