Attempt #2
Aug 06, 6:30 PM

Marks: 5

Q No: 1 Correct Answer

Marks: 1/1

What will be the output of the following code?

```
print(range(5))
```

- (●) range(0, 5) — You Selected
- ( ) range 5
- ( ) 0, 1, 2, 3, 4
- ( ) 0, 1, 2, 3, 4, 5

The range() function is used to generate a sequence of numbers equidistant from each other. It takes 3 parameters, start, stop, and step. Stop is a mandatory parameter and by default, start is set to 0 and step is set to 1. So, range(5) will give the same output as range(0,5).

Q No: 2 Correct Answer

Marks: 1/1

What will be the output of the following code?

```
for i in range(1,5):
    print(i*2)
```

- ( ) i*2
- (●) 2 — You Selected

  4

  6

  8
- ( ) [1, 2, 3, 4]
- ( ) 2

In this question the variable "i" is used to index the various elements of the range 1 to 5 (exclusive). So with print(i*2) Python will call every element at index location multiply it with 2 and print the output.

Iteration 1: i = 1, 1 * 2 = 2
Iteration 2: i = 2, 2 * 2 = 4
Iteration 3: i = 3, 3 * 2 = 6
Iteration 4: i = 4, 4 * 2 = 8

Q No: 3 Correct Answer

Marks: 1/1

Identify the output of the following code

```
sum = 0
for number in range(1,5):
    sum = sum + number
print(sum)
```

- sum
- 15
- 10 You Selected
- 0

Here, the variable "number" is used to iterate over the elements of the range(1,5), which is a sequence of numbers from 1 to 4 (as 5 is exclusive). For each iteration of the for loop, Python will add the value stored in the variable number to the variable sum.
Iteration 1: sum = 0 + number = 0 + 1 = 1
Iteration 2: sum = 1 + number = 1 + 2 = 3
Iteration 3: sum = 3 + number = 3 + 3 = 6
Iteration 4: sum = 6 + number = 6 + 4 = 10
Once all the iterations are completed, the final value of the variable sum will be printed.

Q No: 4 Correct Answer

Marks: 1/1

How many times the following loop will run?

```
i=5
while(i>0):
 i=i-1
```

- (●) 5 — You Selected
- ( ) 4
- ( ) infinite
- ( ) 0

The initial value of variable "i" is 5 and during every iteration of while loop, its value will be subtracted by 1. So, for the first loop, it will be 5 then 4, 3, 2, 1. After five iterations, the value of the variable "i" will be 0. At this point, the condition of the while loop will not be satisfied and the loop will terminate. Hence, the given loop will run for 5 iterations.

Q No: 5 Correct Answer

Marks: 1/1

What will be the output of the following code?

```
x = [1, 2, 3, 4, 5]
while x:
  print(x.pop(0))
```

1

2

3

4

1 2 3 4 5
