Attempt History

Attempt #1
Aug 07, 12:15 PM

Marks: 2

Q No: 1 Correct Answer

Marks: 1/1

What will be the output of the code below?

```
list_1 = [1, 2, 3, 4, 5]
list_comp = [ i for i in list_1 ]
print(list_comp)
```

- [x] [1, 2, 3, 4, 5] — You Selected
- [ ] 1 2 3 4 5
- [ ] 1 2 3 4 5
- [ ] Error

The variable list_1 stores the list [1,2,3,4,5]. The defined list comprehension will run a for loop in which 'i' iterates through each element of list_1 and appends the element to the list list_comp. The print function prints the variable list_comp to give the final output as [1,2,3,4,5].

Q No: 2 Correct Answer

Marks: 1/1

Which of the following codes will print the output below?

```
['Week0', 'Week1', 'Week2', 'Week3', 'Week4']
```

```
week_list = [ "Week" + "i" for i in range(5)]
print(week_list)
```

```
week_list = [ "Week" + i for i in range(5)]
print(week_list)
```

```
week_list = [ Week + str(i) for i in range(5)]
print(week_list)
```

```
week_list = [ "Week" + str(i) for i in range(5)]
print(week_list)
```

You Selected

In the mentioned list comprehension, we are trying to add the string 'Week' before every element of the sequence generated by the range() function. We have to explicitly convert the sequence elements to string type using the str() function before adding the string 'Week' to them. At each iteration, the sequence element is converted to a string and the "eek" is concatenated at the start. Output for the 5 iterations will be as follow

iteration 1: Week + 0 = Week0
iteration 2: Week + 1 = Week1
