Attempt History

Attempt #1
Aug 09, 6:27 PM

Marks: 10

Q No: 1 Correct Answer

Marks: 1/1

Which among the below snippets can be used to print all integers between -10 to -1 including both -10 and -1?

```
for i in range(-10, -1, 1):
 print(i)
```

You Selected

```
for i in range(-10, 0, 1):
 print(i)
```

```
for i in range(-10, -1, -1):
 print(i)
```

```
for i in range(-10, 0, -1):
 print(i)
```

The for loop in Python can be used to iterate over a sequence. A sequence of numbers from -10 to -1 is generated using range(start =-10, stop = 0, step_size = 1)

Q No: 2 Correct Answer

Marks: 1/1

Which of the following snippets can be used to complete the code to print numbers from 1 to 10:

```
n = 10
i = 1
while i <= n:
 print(i)
 # missing code
```

- i = i - 1
- i = i + 2
- i = i + 1 — You Selected
- i = i - 2

The while loop is used to iterates a block of code until the test expression is false. Hence, the counter(i) must be updated to avoid an infinite loop. Here, we increase the counter(i) by 1 to print the sequence of numbers from 1 to 10.

Q No: 3 Correct Answer

Marks: 1/1

Which of the following snippets can be used to complete the code to print the first ten even numbers:

```
for i in range(1, 21):
 # missing code
     print(i)
```

- if i % 2 == 0: — You Selected
- if i % 2 != 0:
- if i % 2 == 0
- if i % 2 != 0

The condition to check even numbers is *i % 2 == 0* and the correct syntax of Python if statement is:

```
if condition:
    statement(s)
```

Q No: 4 Correct Answer

Marks: 1/1

What will be the output of the following Python code?

```
n = 8
for i in range(1, 11):
 print("{} ^ {} =".format(n, i), n**i)
```

- Prints the square of the numbers from 1 to 10
- Prints the multiplication table of 8
- Prints the numbers from 1 to 10
- Prints the power table of 8 — You Selected

The ** operator in Python raises the number on the left to the **power** of the exponent of the right. Hence, the given snippet prints the power table of 8.

Q No: 5 Correct Answer

Marks: 1.50/1.50

Choose the appropriate snippet to print the messages with the following information.

For numbers 1 to 100:

If a number is divisible by 3, then print Fizz.

If a number is divisible by 5, then print Buzz.

If a number is divisible by 3 and 5 both, then print FizzBuzz.

If a number is neither divisible by 3 or 5, just print the number.

```
for i in range(1, 101):
 if(i % 3 = 0 or i % 5 = 0):
     print("FizzBuzz")
 elif (i % 3 == 0):
     print("Fizz")
 elif(i % 5 == 0):
     print("Buzz")
 else:
     print(i)
```

```
for i in range(1, 100):
 if(i % 3 == 0 or i % 5 == 0):
     print("FizzBuzz")
 elif (i % 3 == 0):
     print("Fizz")
 elif(i % 5 == 0):
     print("Buzz")
 else:
     print(i)
```

```
for i in range(1, 100):
 if(i % 3 == 0 and i % 5 == 0):
     print("FizzBuzz")
 elif (i % 3 == 0):
     print("Fizz")
 elif(i % 5 == 0):
     print("Buzz")
 else:
     print(i)
```

You Selected

```
for i in range(1, 101):
 if(i % 3 == 0 and i % 5 == 0):
     print("FizzBuzz")
 elif (i % 3 == 0):
```

```
elif (i % 3 == 0):
    print("Fizz")
elif(i % 5 == 0):
    print("Buzz")
else:
    print(i)
```

range(1, 101) generates a sequence of numbers from 1 to 100. The correct condition to print 'FizzBuzz' is *i % 3 == 0 and i % 5 == 0.*

Q No: 6 Correct Answer

Marks: 1/1

Which of the following snippets can be used to complete the code to find the sum of all numbers from 1 to 100:

```
sum = 0
for i in range(1, 101):
 # missing code
print(sum)
```

- i = i + 1
- sum = sum + i — You Selected
- i = i + sum
- sum = sum * i

In each iteration, the current number(i) is added to the *sum* variable to find the sum of all the numbers.

Q No: 7 Correct Answer

Marks: 1.50/1.50

Choose the appropriate snippet to find all such numbers which are divisible by 7 but are not a multiple of 5, between 202 and 320 (both included):

```
for i in range(202, 321):
 if i % 7 == 0 and i % 5 == 0:
     print(i)
```

You Selected

```
for i in range(202, 321):
    if i % 7 == 0 and i % 5 != 0:
        print(i)
```

```
for i in range(202, 320):
 if i % 7 == 0 and i % 5 == 0:
     print(i)
```

```
for i in range(202, 321):
 if i % 7 == 0 and i % 5 ! 0:
     print(i)
```

range(202, 321) generates a sequence of numbers from 202 to 320. The correct condition to check, if a number is divisible by 7 but not a multiple of 5, is *i % 7 == 0 and i % 5 != 0.*

Q No: 8 Correct Answer

Marks: 1/1

What will be the output of the following Python code?

```
st = "Data Science"
count = 0
for i in st:
 if i == "a" or i == "e" or i == "i" or i == "o" or i == "u":
```

```
    count = count + 1
print(count)
```

- Prints the number of white spaces in the string 'Data Science'
- Prints the number of consonants in the string 'Data Science'
- Prints the number of alphabets in the string 'Data Science'
- Prints the number of vowels in the string 'Data Science' — You Selected

The given Python snippet counts the number of vowels in the string 'Data Science' and prints it.

Q No: 9 Correct Answer

Marks: 1/1

What will be the output of the following Python code?

```
a = "Data Science"
for i in range(0, 5):
 print(a)
```

- `Data Science Data Science Data Science Data Science Data Science`
- `Data Science Data Science Data Science Data Science Data Science Data`
